CHƯƠNG 1

MIDTERM 2022

1 Introduction

In this midterm project, a count-down system is designed and implemented in Proteus simulation. As it can be seen from Fig. 1.1, main components used in this project are the STM32F103C6, one LED, one LED7 segment and 3 different buttons.

Hình 1.1: Proteus schematic for count-down system

The main functions of the system are listed bellow:

- LED7 segment is used to display a counter ranging from 0 to 9.
- The **RESET** button is used to reset the counter value to 0. Meanwhile, the **INC** and **DEC** buttons are used to increase and decrease the counter value, respectively. There are two events need to handle for these buttons, including the normal-press and long-press.
- The D1 LED is blinking every second, which is normally used to monitor the execution of the system.

Students are supposed to following the section bellow, to finalize the project and fill in reports for their implementations. Some important notes for your midterm are listed bellow:

- The timer interrupt is 10ms. The value for counter is 9 (10 is also acceptable) when the pre-scaller is 7999.

- All the buttons must be DEBOUNCING by using a timer interrupt service routing. A timeout for long press event is 3 seconds.
- There is no HAL_Delay() function in your source code. All the delay behavior must be based on a software timer.
- This report must be submitted with your answer.
- GitHub link for the source code and demo video link must be public access.

2 Implement and Report

2.1 Proteus schematic - 1 point

In this part, students propose the connection of the LED7 segment and 3 buttons to the STM32F103C6.

Your report: The schematic of your system is presented here. The screen can be captured and present in this part.

2.2 State machine Step 1 - 2 points

A state machine is required in this step to perform just only the normal-press (or a button push) behavior of three buttons:

- Whenever the RESET is pressed, the counter value is 0.
- When INC is pressed, the counter is increased by 1. When counter is 9, it comes back to 0.
- When DEC is pressed, the counter is decreased by 1. When counter is 0, it rolls back to 9.

The value of the counter is displayed on the LED7 Segment.

Your report: Present your state machine in this part.

Your report: Present a main function, which is used to implement the state machine. This function should be invoked in main().

```

1 void fsm_simple_buttons_run() {
2     //TODO
3 }
```

Program 1.1: Implementation of the state machine

2.3 State machine Step 2 - 2 points

In this part, long-press events for INC and DEC buttons are added to the project. For a button, this event is raised after 3 seconds keep pressing the button.

When a long-press event is detected, the value of counter keeps changing every 1 second until the button is released. For example, the current value of counter is 2 and the INC button is pressed. The value of counter immediately increased by 1, or counter = 3. The INC button keeps pressing for 3 seconds, then the value of counter is 4. As long as the INC button is pressed, the value continues increasing **every 1 second**. This behavior is illustrated in the Figure bellow:

Hình 1.2: Long press behavior for INC button

The behaviors of the DEC button are reversed to the INC button. The value of counter is also roll back if it reaches 0 or 9.

Your report: Present your whole state machine when the long press events are added.

Your report: Present a main function, which is used to implement additional states. Minor changes in the previous source code are note required to present here.

2.4 State machine Step 3 - 2 points

Finally, where there is no button event after 10 seconds, the value of of counter is counted down and stopped at 0. If the INC or DEC are pressed again, the status of the system comes back to previous state, which is designed in Subsection 2 or 3.

Your report: Present your whole state machine for the 10s time-out event.

Your report: Present a main function, which is used to implement additional states. Minor changes in the previous source code are note required to present here.

2.5 Led Blinky for Debugging - 1 point

Finally, for many projects based on microcontroller, there is an LED keeps blinking every second. In this project, the LED connected to PA5 is used to perform this feature.

Your report: Present your solution and the source code for this feature. It can be very simple source code or a new state machine for this LED. If a state machine is used, please present it in the report.

2.6 Github and Demo

A link to your github presented the last commit of your project is provided in this section. This link contains all files in your STMCube project (configurations, header and source files)

[Your github link](#)

And a link for just one demo video is also needed to present here.

[Your video link](#)

3 Extra exercise - Engineer mindset -1 point

In this course, we encourage you to obtain an innovative mindset to solve daily problem. In this question, we would expect you to write a C program to solve the following problem.

Suffix with Unit

EXample:

1 suffixWithUnit(123) => 123

2 suffixWithUnit(1234) => 1.234 Kilo

3 suffixWithUnit(12345) => 12.345 Kilo

4 suffixWithUnit(1234567) => 1.234567 Mega

5 suffixWithUnit(12345678) => 12.345678 Mega

Prototype

```
1 string suffixWithUnit(double number) {  
2 }
```

How would you solve them? Please share your thinking to solve this problem and provide your answer.

Answer:

```
1 /*  
2     NguyenQuocAnh-1852238  
3     Programmed & Compiled on Online C Compiler  
4     https://www.onlinegdb.com/online_c_compiler  
5 */  
6  
7 #include <stdio.h>  
8 #include <stdlib.h>  
9 #include <string.h>  
10  
11 //Conversion function - the focus point  
12 const char* suffixWithUnit(double number) {  
13     //INIT buffer  
14     static char buf[128];  
15     //INIT suffix table  
16     char suffix[8][10] = {" Kilo", " Mega", " Giga", " Tera",  
17     " Peta", " Exa", " Zetta", " Yotta"};  
18     //Intermediate to calculate number of power 10^unit =  
19     number  
20     double numberdiv = number;  
21     int unit = 0;  
22     while (numberdiv > 999) {  
23         numberdiv/=1000;  
24         unit++;  
25     }  
26     //Add suffix  
27     if (unit > 0) {  
28         if (unit < 9) {  
29             //Double to char array, %g copy without  
30             trailing zeros  
31             sprintf(buf, "%g", numberdiv);  
32             //Add suffix  
33             strncat(buf, suffix[unit - 1], 10);  
34         }  
35         else {  
36             //find 10^x 'tenx'  
37             int tenx = 0;  
38             double numberdiv10 = numberdiv;  
39             while (numberdiv10 > 9) {  
40                 numberdiv10/=10;  
41                 tenx++;  
42             }  
43         }  
44     }  
45     return buf;  
46 }
```

```

39         }
40         tenx+=unit*3;
41         //Double to char array, %g copy without
trailing zeros
42         sprintf(buf, "%g", numberdiv10);
43         //Add 'e+tenx'
44         char esuffix[10];
45         sprintf(esuffix, "%d", tenx - 24);
46         strncat(buf, "e+", 3);
47         strncat(buf, esuffix, 10);
48         //Add suffix
49         strncat(buf, suffix[7], 10);
50     }
51 }
52 else {
53     //Double to char array, %g copy without trailing
zeros
54     sprintf(buf, "%g", numberdiv);
55 }
56 return buf;
57 }
58
59 //Main function for testing
60 int main()
61 {
62     //INIT number here
63     double number = 100e24;
64     //Print result
65     printf("INPUT : %g\n", number);
66     printf("RESULT: ");
67     puts(suffixWithUnit(number));
68     return 0;
69 }

```

Summary:

```

59 //Main function for testing
60 int main()
61 {
62     //INIT number here
63     double number = 12345678;
64     //Print result
65     printf("INPUT : %g\n", number);
66     printf("RESULT: ");
67     puts(suffixWithUnit(number));
68     return 0;
69 }

```

INPUT : 1.23457e+07
RESULT: 12.3457 Mega

...Program finished with exit code 0
Press ENTER to exit console.

Hình 1.3: Compiled online

My perspective: one "unit conversion" program is needed, and since the subject is computer related, I chose the *Metric Prefix* syntax and rules https://en.wikipedia.org/wiki/Metric_prefix.

[org/wiki/Metric_prefix#List_of_SI_prefixes](https://en.wikipedia.org/wiki/Metric_prefix#List_of_SI_prefixes) but they are implemented as *Suffixes*.

The program is tested and ran well on the Online C Compiler https://www.onlinegdb.com/online_c_compiler.

Background thoughts:

Provided that the *INPUT* follows "computer logic": non-negative (negative values are acceptable but not covered by the unit conversion), the *INPUT* will have a specific new suffix if the value surpasses 10^3 . In other words, for every 10^3 increment of value, the suffix will change accordingly.

For example: $1000,000,000 = 1e+9 = 1 \text{ Giga}$. Until it reaches 1000 *Yotta*, then the syntax of suffix becomes $e + n \text{ Yotta}$. For example: $1e26 = 100 \text{ Yotta}$; $1e28 = 1e + 4 \text{ Yotta}$.

Finally, if the *INPUT* doesn't follow the above "computer logic", then the result will remain as is (no changes).

Quick recap of the implementation: The *INPUT* will be divided definitely by 1000 (to find the 10^3 increment). Appropriate suffixes will be attached accordingly.

If the value exceeds 999 *Yotta*, the leftover result will be divided definitely by 10, to find the "leftover 10^1 increments". Finally convert the result into the very last syntax as explained above.
